15	iPads	10.00	40.00
16	IPhones	31.00	414.00

Influence of discount level on sales

Recommendations

Technical - Data Collection

- Switch to 14 'Categories' instead of 66 numerical 'types' for smoother reporting
- Use input restrictions in the Heads up display(HUD) to ensure data consistency
- Resolve inconsistent number formatting issues to accelerate data cleaning and insight generation

Discount strategy

- For summer and winter sales, reduce discounts by 9-19% for product lines which don't translate to revenue
- Obtain customer-level data to analyse discounts' impact on customer acquisition, retention, satisfaction

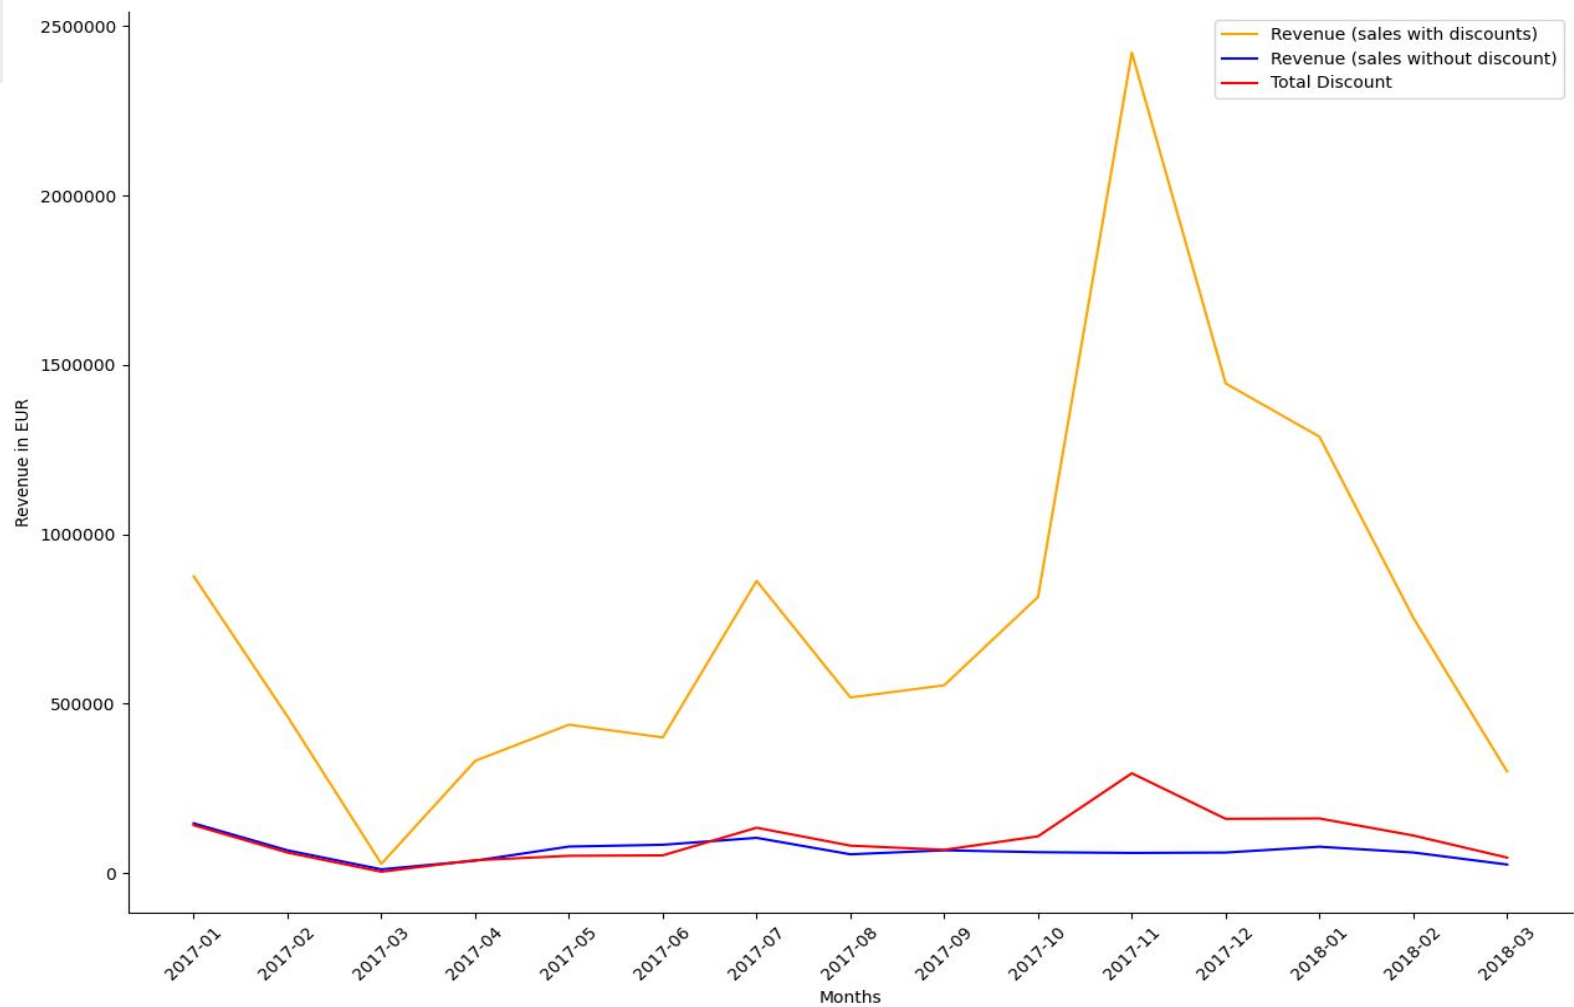

Annex

Context and business questions

The Marketing Team Lead is convinced that offering discounts is beneficial in the long run. She believes discounts improve customer acquisition, satisfaction and retention, and allow the company to grow.

The main investors in the Board are worried about offering aggressive discounts. They have pointed out how the company's recent quarterly results showed an increase in orders placed, but a decrease in the total revenue. They prefer that the company positions itself in the quality segment, rather than competing to offer the lowest prices in the market.

- INTRODUCTION: What is the time period that the dataset covers? What is the overall revenue for that time? (+ we only included completed orders)
- CURRENT SITUATION: How many products are being discounted? How big are the offered discounts as a percentage of the product prices?
- PRODUCT CLASSIFICATION: How should products be classified into different categories to simplify reports and analysis?
- ANALYSIS: Which product categories are being discounted? What are the most sold products? What are the products that generate the most revenue?
- SEASONALITY ANALYSIS: How do seasonality and special dates (Christmas, Black Friday) affect sales?
- What is the distribution of product prices across different categories?
- RECOMMENDATIONS: How could data collection be improved?

Count by Category and Price Tier
